Abstract of **EP0015443**

1. Medical apparatus for the introduction or removal of liquids by means of a syringe comprising a housing (17) having a cylindrical wall (24) into which a clamping sleeve (7) is fitted whose passage (10) serves as an insert opening for the cone portion (15) of the syringe (14) and whose plan end surface (5) presses the edge portion (28) of a valve body designed as an elastic plate (1) having a self-closing liquid passage opening against an annular shoulder (4) of the housing (17) at the transition to a main flow channel (6), characterized in that there is connected to the edge portion (28) of the plate (1) via resilient radial webs (22) a central part (21) of the plate (1) which in mounting position of the plate (1) sealingly adjoins in the plane of the edge portion (28) the end surface (5) of the clamping sleeve (7).
